The concept of decking to clip

www.gradconcept.com

The Private Manufacturing Unitary Enterprise "Postavy Furniture Center" (PMC) from Belarus produces interior doors of pine, alder and oak during more than 20 years.Recently production of three-layer one-lane parquet board of oak and pine was launched. Our products can be more rarely met in Belarus, but practically in all regions of the Russian Federation, the Baltic States, Ukraine, Azerbaijan, Italy and Denmark, and even in Iraq and Libya. The wood pellets, which are produced by our enterprise, are sold to the countries of the European Union (Italy, Czech Republic, Slovakia, Slovenia, Lithuania, Latvia). Our enterprise takes an active part in international exhibitions which are conducted in Milan, Oslo, Moscow and Germany. Also we have the show rooms in Kuwait, Oman, the United Arab Emirates and Canada.

Panaget

Flooring company Panaget has expanded its range of 100% French oak floors with the new Café Crème and Miel finishes. These supremely cosy finishes have arrived on the scene to warm up our homes just in time for winter. Café Crème and Miel are also lacquered wood floors, making them incredibly easy to maintain. Café Crème is a great alternative to natural wood flooring. Its subtle, slightly milky finish lends it a charming and contemporary look. The oak planks add to Café Crème's charm with their distinctive grain (Zenitude grade): knots, cracks, heartwood markings etc. Meanwhile, the Miel wood floors will appeal to those seeking an ultra-natural look. With their golden, crème brûlée hue, these new planks are truly timeless. The elegant lacquer enhances the oak's mellow yet distinctive markings (Authentic grade). These lacquered wood floors are ideal for any interior design project.

PEDROSS

PEDROSS presented several new product highlights at this year's Domotex and was met with a consistently positive response from the visitors. They were impressed by the innovative clip system Clipstar Fast and intensively tested the quick, easy and, most importantly, tool-free clip system for skirting boards. The new solid spruce wood profiles, which were developed in close cooperation with the long-term partner Döllken Profiles and are characterized by a highly resistant, chlorine-free PP-based surface foil, were equally well received. Thus, the two companies successfully created a modern product family in trendy

adsprogetto

Rhinowood™ is the environmentally sustainable and innovative solution to the long-term future of wood and its application in our world. Rhinowood™ is distributed in Europe by Ravaioli Legnami.

Ravaioli Legnami: wooden solutions for outdoor. A world of quality and natural design.

white and modern cubic shape. Additionally, PEDROSS demonstrated what the future could look like with its direct digital print: designs of exclusive or protected woods, oak decors or extraordinary ideas are printed directly on base materials such as polystyrene, natural spruce wood, mirror glass or magnetic stripes.

Perfilstar

One more year Perfilstar has been exhibiting in Domotex. We are satisfied with the results and grateful for all the visits that we had. This year we were very excited introducing our lacquered profiles, we have recently installed a second factory specially concieved for the production of lacquered and prelack profiles. Feedback has been very positive and all the visitors have shown special interest on them. Moreover, we have keep showing our PVC profiles (100% water resistant), the perfect skirting for SPC Flooring. Right now we consider ourselves as one of the few companies that offer such a big range of solutions, either for laminate, solid wood or LVT floorings.
We are also happy after all then new contacts we have made, we believe is a new opportunity to enlarge our market opportunities.

Prinz

Prinz begins 2020 with an innovation offensive
Wide-ranging programme of innovations for Domotex Trade Fair
Domotex presents a good opportunity right at the beginning of the year to carry forward the innovation strategy and further expand the range of products. Among the innovations are a flexible expansion joint system, border joint profiles, inner and outer edges for wall coverings

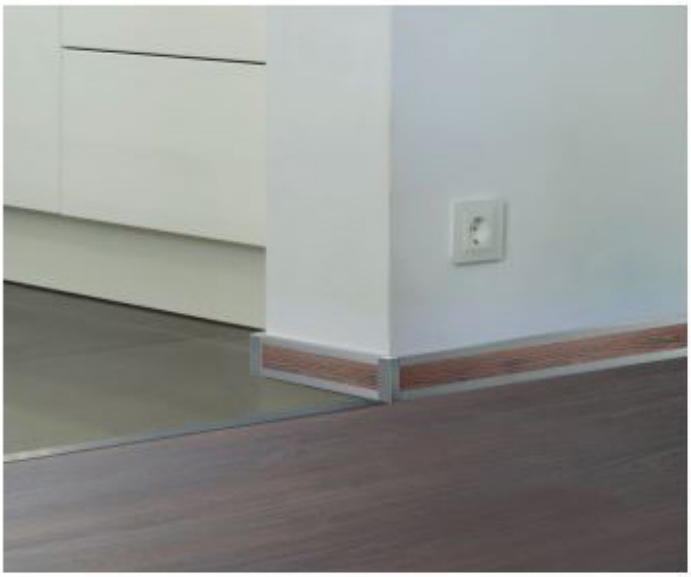
and numerous other types of profile. Further designs and internal and external profiles have been added to the range of aluminium skirting boards. Prinz is also presenting new metallic decors in Hanover in January; these were already successfully introduced to a large group of customers in the autumn. The "footfall sound insulation" programme has also been reworked. Prinz is introducing the new underlays for LVT and SPC floor coverings at the Domotex. The programme relaunch is accompanied by a new sample presentation, available from February 2020. "Thanks to this package we are providing our distribution partners and processing customers with the prerequisites to be able to meet almost all the requirements of architects and clients. This will strengthen our competitive edge in the area of new builds and modernisation projects," is the optimistic view of Marketing Manager Norbert Blach.

Proligna

Domotex 2020 was a new experience for the Q-Floor team. Both new potential international customers and existing customers visited our stand where they got a good picture of our options and the different product groups: Q-Floor, Q-Profile, Q-Wall Indoor & Outdoor and Q-Panel. Due to the increasing demand for herringbone parquet, our Q-Bone collection (oak and walnut) was put in the spotlight. We can tell that this trend still exists from the many positive reactions. Afterwards we can look back with satisfaction on this successful debut!

aluminum design skirting. This is suitable for bonding 2 to 3 mm floorings and adapts optimally in every room by the combination with the laid design floor. This skirting board is available in the anodized colors silver and stainless steel coloured as standard colours. Other anodized colours or with powder coating are available on request. Matching inside and outside corners can either be miter cut or manufactured as a 30x30 mm corner by us. To see all news 2020 meet us at our booths at **Domotex 2020** in Hannover **(hall 13 booth D01)**, at **EuroShop 2020** in Düsseldorf **(hall 5 booth 5C01)** and at **CASA 2020** in Salzburg **(hall 10 booth 0732)**.

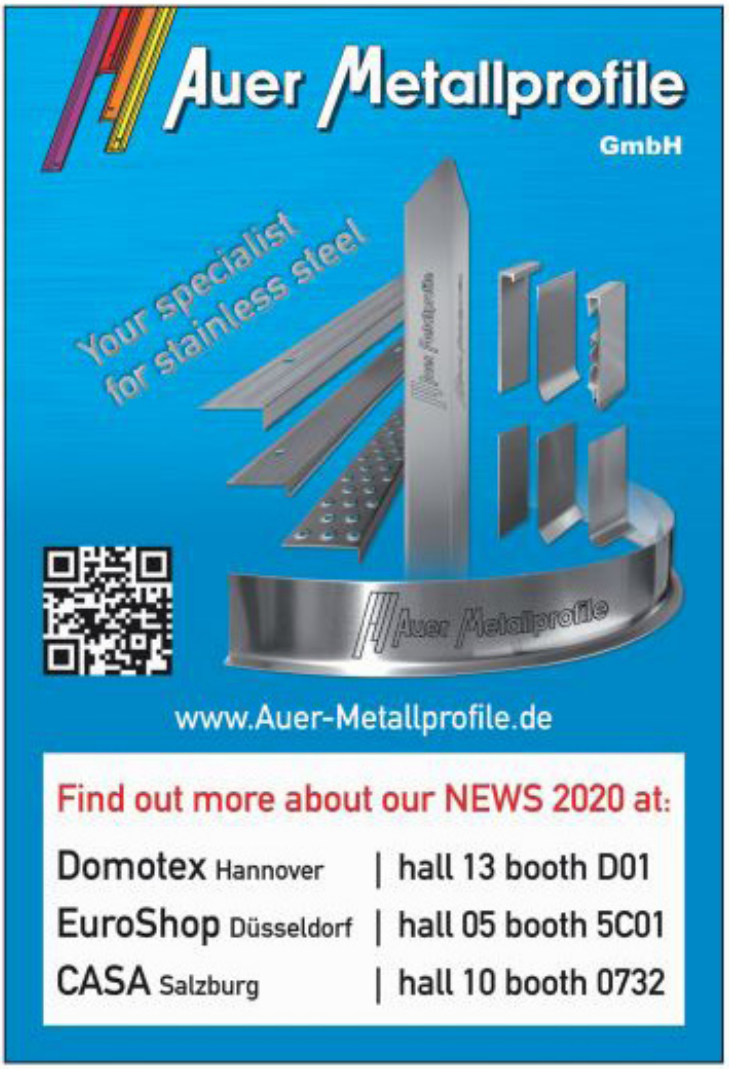
Küberit



Küberit offers a collection of skirting boards with digital printings. Due to our the high-res printing technology, we achieve decors that match the floors perfectly. In addition, we have two skirting boards in our range, where flooring inlays can be clicked in: For the profile type 950 it is possible to insert LVT of 2 mm and more, as well as laminate up to 11 mm. The inlays are inserted into the skirting boards at the construction site, as the strips are simply cut off from the floor covering with a cutter. In the case of an LVT, this is much easier, in the case of a laminate floor this is more time-consuming. When cutting the strips, all you have to ensure is that they have the correct height to be slide or clipped into the skirting board. All our skirting boards are made of high-quality aluminium and are therefore highly robust and impact-resistant. The collection is complemented by corners, caps and connectors.

FN Neuhofer

The skirtings from Neuhofer match the floor completely. Thanks to the innovative "FN digiprint technology" skirtings, floor profiles as well as accessories such as corner sticks and radiator rosettes, can be produced in identical decoration to the flooring. It makes no difference whether this relates to a paper-film decoration for laminate flooring or digital printed alternative materials like veneer for parquet flooring. Thanks to a special manufacturing process also surfaces with the highest abrasion values and gloss finish can be produced. That means that Neuhofer always has the right profile to offer their customers, for any application. The Neuhofer portfolio includes aluminium skirtings for vinyl floors in which floor strips, e.g. various thicknesses of vinyl can be laid, and the skirting automatically levels up the different floor thicknesses of 3,5 - 5 mm. Laminate inlays in skirtings are also possible. The profile KU037 is designed for the wall connection to design coverings with the advantage that you can attach a strip of the floor to the profile and thus achieve a finish with the same decoration. Normally the professional fitter prepares the inlay on site because they have to use the same material as the floor. The form of the inlay depends on the floor. Regarding the bearing elements, Neuhofer uses different kinds of carrier materials like MDF, solid wood, aluminium or plastic.



PEDROSS

The PEDROSS range includes skirting boards made from solid wood but also from finger-jointed spruce and MDF boards. Different aluminium and PVC products complete the product portfolio. Moreover, the company offers digitally matched skirting boards on foil and veneers, which completely match the customer's individual floors, and is implementing its new, direct digital printing technology that allows to reproduce the structure of the floor on the skirting with a tactile 3D texture. Even the production of hollow profiles in which every customer can insert a strip of their floor is possible. However, the inlay must be fitted by the fitter or client. As with many of its products, PEDROSS relies on a close cooperation with the customers and customizes them according to their individual needs.

Progress Profiles

Progress Profiles produces a wide range of skirting boards following the latest trends to give to environment a modern and minimal design. Among all the products, SKIRTING 7016 and SKIRTING 7011 are two new skirting for floating floors in laminate wood and, thanks to over 80 different shades of wood, they can be chosen of the same color of the floor, by harmonizing the space. Made of PVC foam, their laying can be performed with gluing (acetic silicone-acrylic-mastic) or with a simple structure fixed with screws, bolts or nails. Proskirting INS, instead, is an innovative skirting board profile in anodized silver aluminum designed with an integrated system for plasterboard walls and devised to create a recessed skirting. All of the skirting boards produced by Progress Profiles satisfy all the customer's wishes, they can be laid immediately and are realized in different measures.
